8.3 Show that a Quadrilateral is a Parallelogram

Goal: Use properties to identify parallelograms.

1. Show the quadrilateral is a parallelogram by using the SLOPE of the sides.

$$m_{KL} = \frac{2}{2} = 1 \quad m_{KN} = -\frac{4}{2} = -2$$

$$m_{LM} = \frac{2}{2} = 1 \quad m_{LN} = -\frac{4}{2} = -2$$

PARALLEL

$$m = \frac{y_2 - y_1}{x_2 - x_1} \quad \frac{\text{rise}}{\text{run}}$$

Which theorem is demonstrated in example 1?

2 PAIR OF PARALLEL OPPOSITE SIDES \rightarrow PARALLELOGRAM

2. Show the quadrilateral is a parallelogram by using the LENGTH of the sides.

$$KL = \sqrt{2^2 + 2^2} = \sqrt{8}$$

$$NM = \sqrt{2^2 + 2^2} = \sqrt{8}$$

$$LM = \sqrt{4^2 + 2^2} = \sqrt{20}$$

$$KN = \sqrt{4^2 + 2^2} = \sqrt{20}$$

$$d = \sqrt{(\text{RUN})^2 + (\text{RISE})^2}$$

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

or

$$d = \sqrt{x^2 + y^2}$$

Which theorem is demonstrated in example 2?

2 PAIR OF OPPOSITE SIDES $\cong \Rightarrow$ PA...

3. Show the quadrilateral is a parallelogram by using the SLOPE and LENGTH of one pair of opposite sides.

$$m_{KN} = -\frac{4}{2} = -2 \quad \left\{ \begin{array}{l} m_{LM} = -\frac{4}{2} = -2 \\ LN = \sqrt{4^2 + 2^2} = \sqrt{20} \end{array} \right.$$

Which theorem is demonstrated in example 3?

ONE PAIR OF OPPOSITE SIDES IS BOTH \cong AND $\parallel \rightarrow$ PARALLELOGRAM

4. Show the quadrilateral is a parallelogram by using the DIAGONALS MIDPOINT.

$$\text{MIDPOINT OF } \overline{KM}: \left(\frac{2+6}{2}, \frac{2+0}{2} \right) = (4, 1)$$

$$\text{MIDPOINT OF } \overline{LN}: \left(\frac{4+4}{2}, \frac{4+(-2)}{2} \right) = (4, 1)$$

Which theorem is demonstrated in example 4?

DIAGONALS BISECT EACH OTHER \therefore PARALLELOGRAM
